

## Information Sheet

**Firefly Magic™** electronic firefly lights utilize the newest high tech microchip technology to accurately replicate the unique flickering, flashing, and glow of real fireflies. To ensure a variety of installation options, there are 3 power supply choices: Solar, 12 Volt landscape transformer, and Battery powered.

		
Solar powered	12v transformer powered	Battery powered
<b>FMS Models</b> Solar powered with 2- AA rechargeable Ni-Cd batteries  FMS-07 & FMS-12	<b>FMT Models</b> Connects to an existing UL approved 12 Volt AC landscape transformer  FMT-07 & FMT-12	<b>FMB Models</b> Battery powered by 3 standard AA batteries  FMB-07 & FMB-12

The above Models may be ordered with either seven (7) or twelve (12) electronic fireflies. Each of the small 3mm (1/8") electronic firefly lights is located at the end of individual UL approved, sunlight-resistant, dark brown wire that can be easily shaped, twisted, and attached to blend seamlessly into the landscape. Wire lengths for each individual firefly vary. Models with 7 fireflies have a 20' span and 12 firefly models span 24'. Custom wire lengths are also available.

The 'electronic brain' that controls the flash and flicker of each individual firefly is sealed in a waterproof UL case for FMT & FMB Models and ensures the microelectronics will last for many years. The FMS Solar Models house the microelectronics in an ABS plastic garden lantern fixture.

Each electronic firefly light lasts for more than 100,000 hours, supplying many years of magical firefly fun and enjoyment to family, friends, and guests. Because these special fireflies do not generate heat while operating, they can be safely placed almost anywhere.

While there are greater than 2000 species of firefly in the world, and over 200 in the United States, each variety has its own distinctive flash rate and color. The standard Firefly Magic™ Lights replicate the Arthropoda: Insecta: Coleoptera: Lampyridae: Photuris by emitting a peak wavelength at 565 nanometers of light, which appears to most of us as lime-green in color. Custom Firefly Magic™ electronic firefly light colors are also available to replicate the Pholinus and Pyraclomena species with their respective yellow and amber flashes.
